

# Fully Integrated Linear Single Cell Li-Ion Battery Charger with Power Path

## General Description

The RT9503 is a fully integrated low cost single-cell Li-Ion battery charger IC ideal for portable applications. The RT9503 is capable of being powered up from AC adapter and the USB (Universal Serial Bus) port inputs. The RT9503 can automatically detect and select the AC adapter and the USB port as the power source for the charger. The RT9503 enters sleep mode when both supplies are removed.

The RT9503 optimizes the charging task by using a control algorithm including preconditioning mode, fast charge mode and constant voltage mode. The charging task is terminated as the charge current drops below the preset threshold. The USB charge current can be selected from preset ratings 100mA and 500mA, while the AC adapter charge current can be programmed up to 1A with an external resistor. The internal thermal feedback circuitry regulates the die temperature to optimize the charge rate for all ambient temperatures.

The RT9503 features 18V and 7V maximum rating voltages for AC adapter and USB port inputs respectively. The other features are external programmed safety timer, under voltage protection, over voltage protection for AC adapter supply, battery temperature monitoring, power supply status indicators and charge status indicator.

## Ordering Information

- RT9503 □ □
- Package Type  
QW : WQFN-16L 3x3 (W-Type)
  - Lead Plating System  
P : Pb Free  
G : Green (Halogen Free and Pb Free)

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

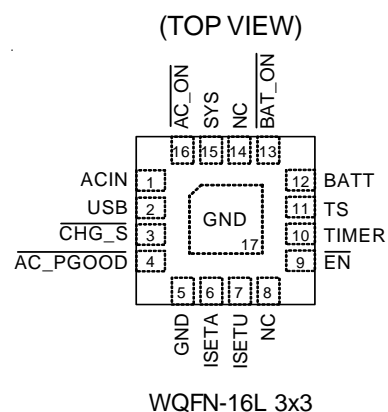

## Features

- Automatic Input Supplies Selection
- 18V Maximum Rating for AC Adapter
- Integrated Selectable 100mA and 500mA USB Charge Current
- Internal Integrated Power FETs
- AC Adapter Power Good Status Indicator
- Charge Status Indicator
- External Capacitor Programmable Safety Timer
- Under Voltage Protection
- Over Voltage Protection
- Automatic Recharge Feature
- Battery Temperature Monitoring
- Small 16-Lead WQFN Package
- Thermal Feedback Optimizing Charge Rate
- Power Path Controller
- RoHS Compliant and 100% Lead (Pb)-Free

## Applications

- Digital Cameras
- Cellular Phones
- PDAs and Smart Phones and MP3
- Portable Instruments

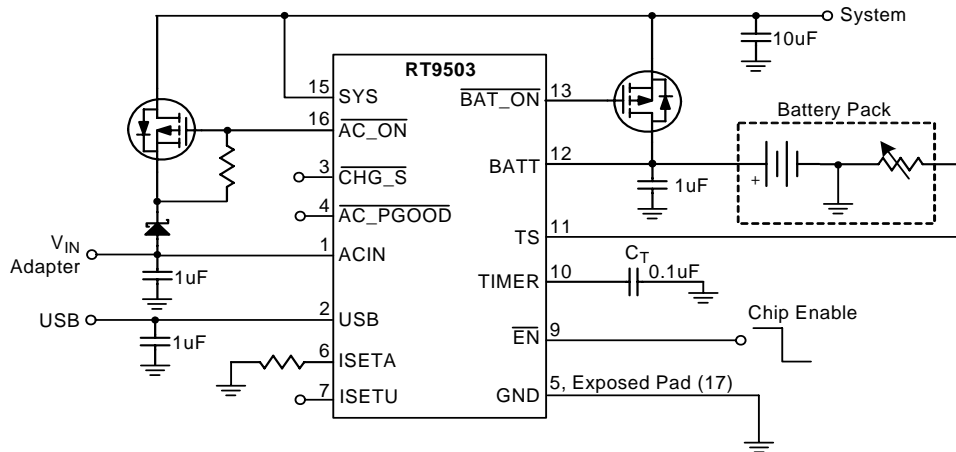

## Pin Configurations

## Marking Information

For marking information, contact our sales representative directly or through a Richtek distributor located in your area.

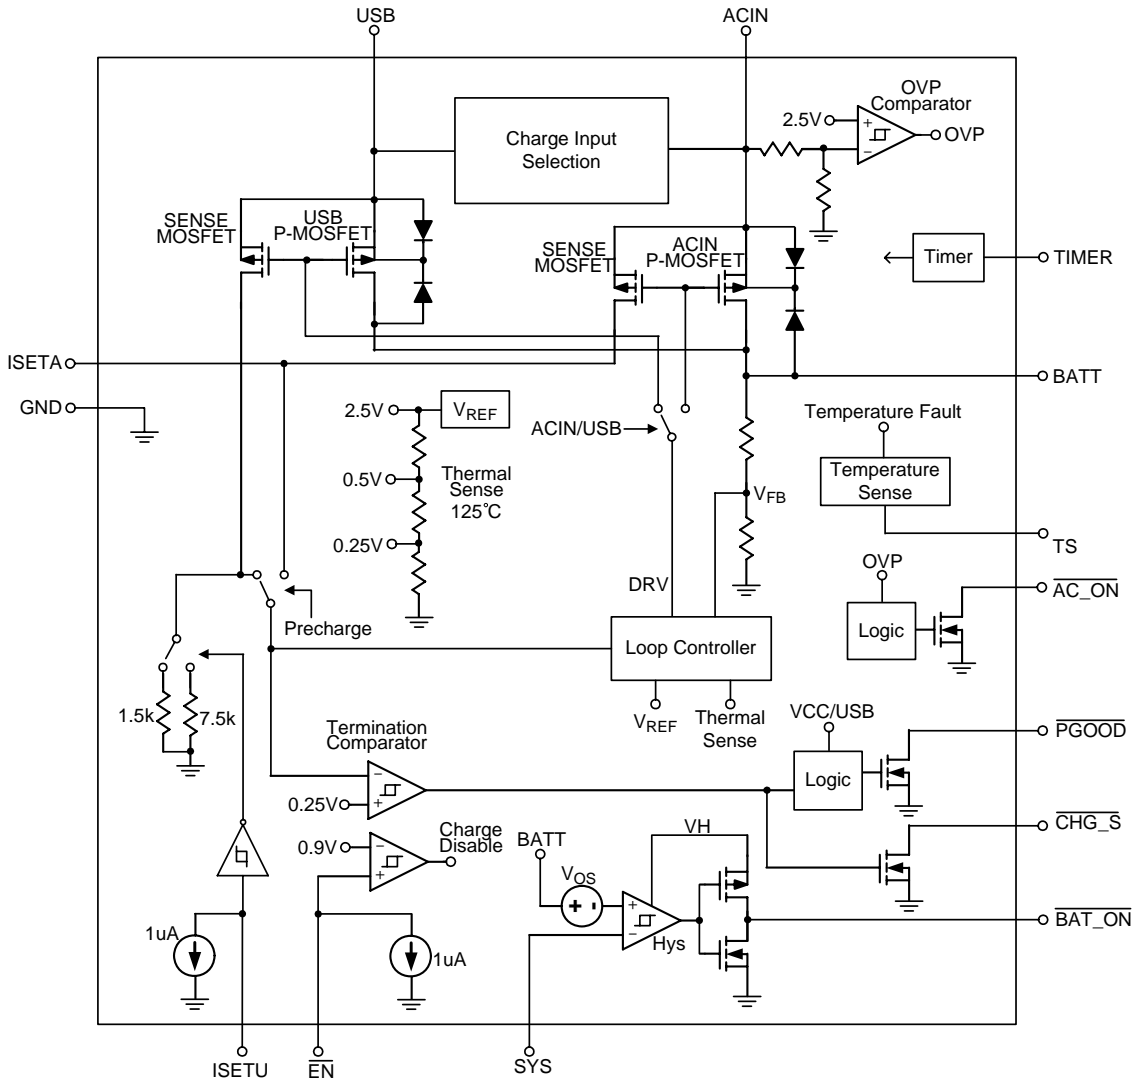

## Typical Application Circuit

## Functional Pin Description

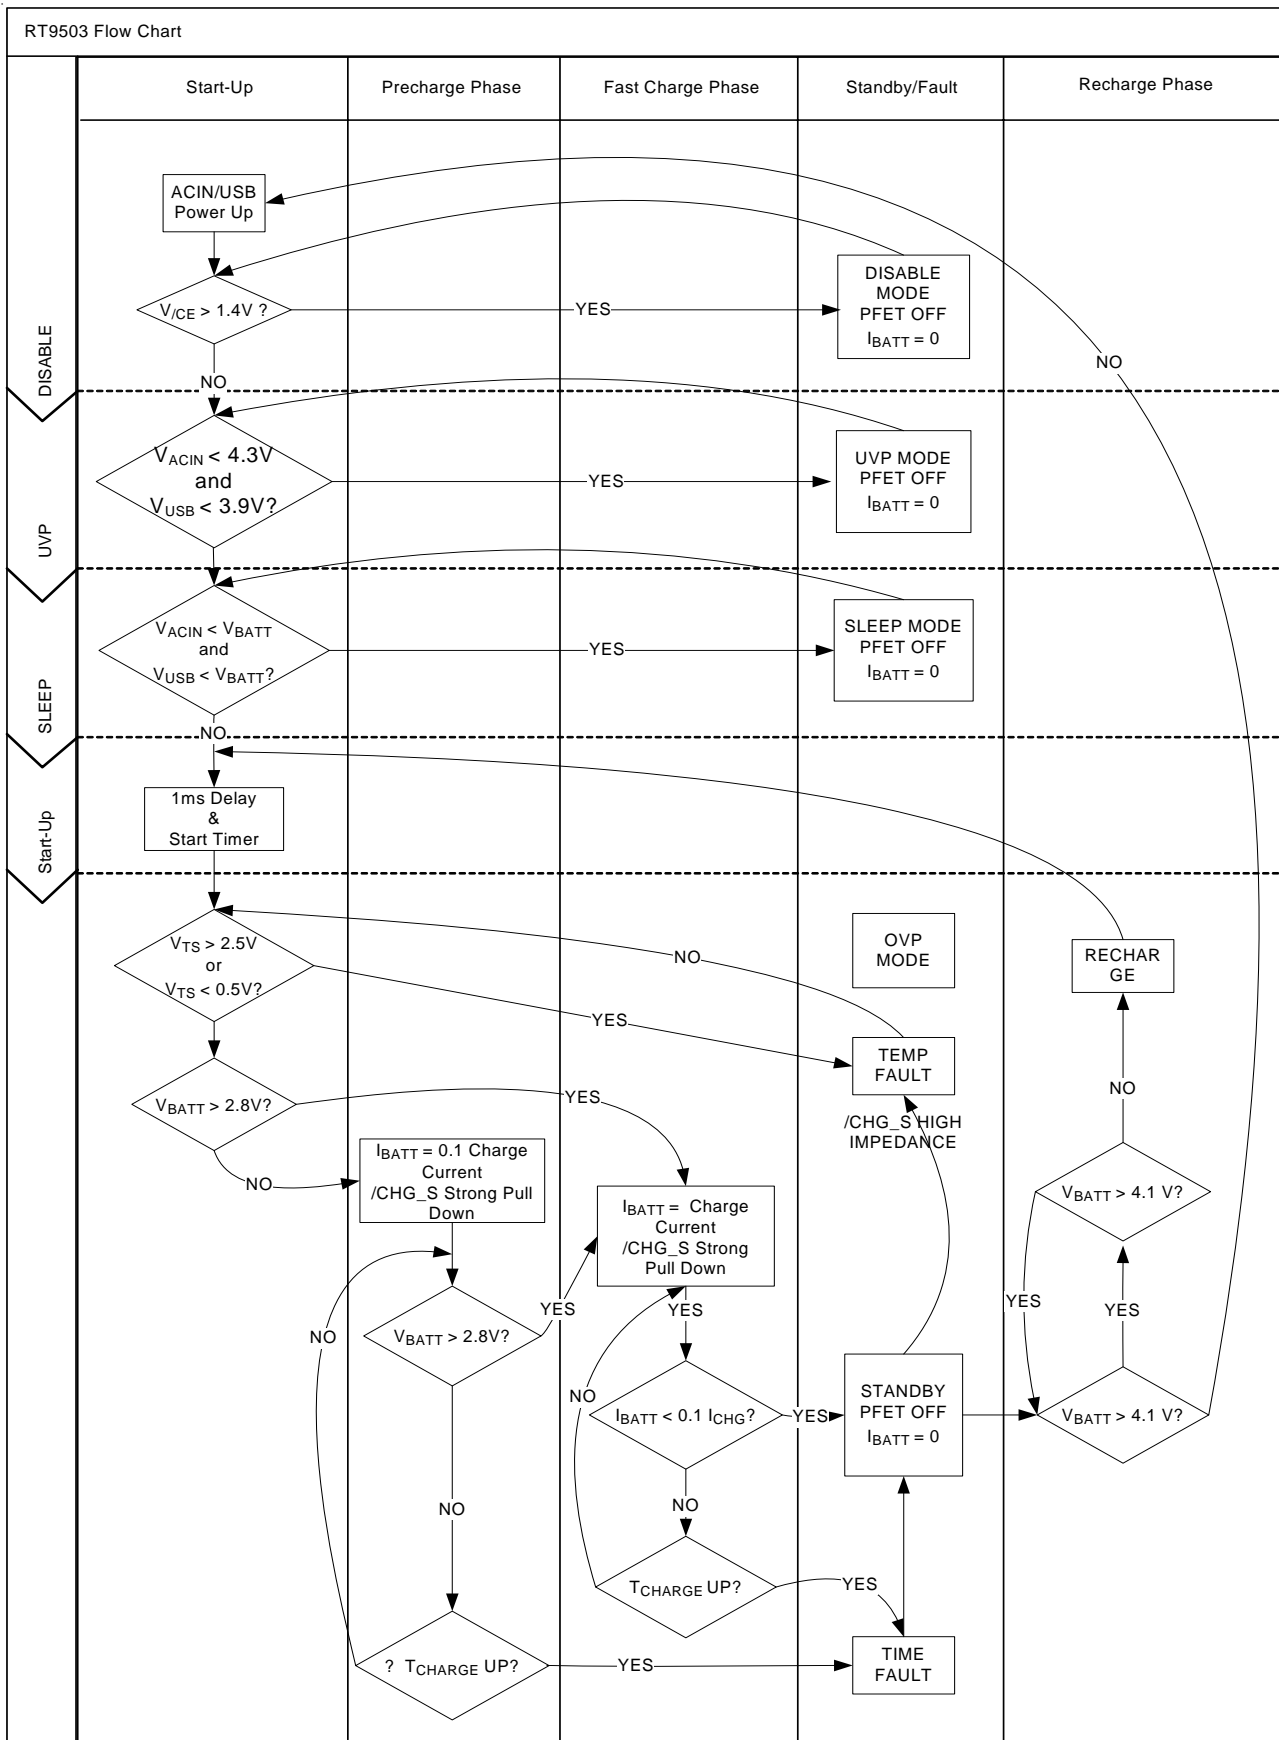

Pin No.	Pin Name	Pin Function
1	ACIN	Wall Adaptor Charge Input Supply.
2	USB	USB Charge Input Supply.
3	CHG_S	Charge Status Indicator Output (open drain).
4	AC_PGGOOD	Wall Adaptor Power Good Indicator Output (open drain).
5	GND	Ground.
6	ISETA	Wall Adaptor Supply Charge Current Set Point.
7	ISETU	USB Supply Charge Current Set Input (active low).
8, 14	NC	No Internal Connection.
9	EN	Charge Enable (Active Low).
10	TIMER	Safe Charge Timer Setting.
11	TS	Temperature Sense Input.
12	BATT	Battery Charge Current Output.
13	BAT_ON	Power path controller output, low to turn on the external P-MOSFET.
15	SYS	System Voltage Detecting Pin.
16	AC_ON	P-MOSFET Switch Control Output (open drain).
17 (Exposed Pad)	GND	The exposed pad must be soldered to a large PCB and connected to GND for maximum power dissipation.

Table

**Absolute Maximum Ratings** (Note 1)

- Supply Input Voltage, ACIN ----- -0.3V to 18V
- Supply Input Voltage, USB ----- -0.3V to 7V
- CHG\_SB, AC\_PGOOD, AC\_ON ----- -0.3V to 18V
- Other Pins ----- -0.3V to 5.5V
- Power Dissipation, P<sub>D</sub> @ T<sub>A</sub> = 25°C  
 WQFN-16L 3x3 ----- 1.667W
- Package Thermal Resistance (Note 2)  
 WQFN-16L 3x3, θ<sub>JA</sub> ----- 60°C/W  
 WQFN-16L 3x3, θ<sub>JC</sub> ----- 8.2°C/W
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Junction Temperature ----- 150°C
- Storage Temperature Range ----- -65°C to 150°C
- ESD Susceptibility (Note 3)  
 HBM (Human Body Mode) ----- 2kV  
 MM (Machine Mode) ----- 200V

**Recommended Operating Conditions** (Note 4)

- Supply Input Voltage Range, ACIN ----- 4.5V to 12V
- Supply Input Voltage Range, USB ----- 4.1V to 6V
- Junction Temperature Range ----- -20°C to 125°C
- Ambient Temperature Range ----- -20°C to 85°C

**Electrical Characteristics**

(ACIN = USB = 5V, T<sub>A</sub> = 25°C, unless otherwise specification)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
<b>Supply Input</b>						
ACIN UVP Rising Threshold Voltage	V <sub>UV_ACIN</sub>		4.1	4.3	4.5	V
USB UVP Rising Threshold Voltage	V <sub>UV_USB</sub>	V <sub>BATT</sub> = 3V	3.7	3.9	4.1	V

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
BAT_ON Pull High		As SYS Raising, V <sub>BATT</sub> = 4V, SYS-BAT	-50	--	0	mV
BAT_ON Pull Low Switch Resistance		V <sub>BAT</sub> = 4V	--	10	--	Ω
BAT_ON Pull High Switch Resistance		V <sub>ACIN</sub> = 5V	--	30	--	Ω

**Note 1.** Stresses listed as the above “Absolute Maximum Ratings” may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

**Note 2.**  $\theta_{JA}$  is measured in the natural convection at T<sub>A</sub> = 25°C on a high effective four layers thermal conductivity test board of JEDEC 51-7 thermal measurement standard. The case point of  $\theta_{JC}$  is on the expose pad for the package.

**Note 3.** Devices are ESD sensitive. Handling precaution is recommended.

**Note 4.** The device is not guaranteed to function outside its operating conditions.

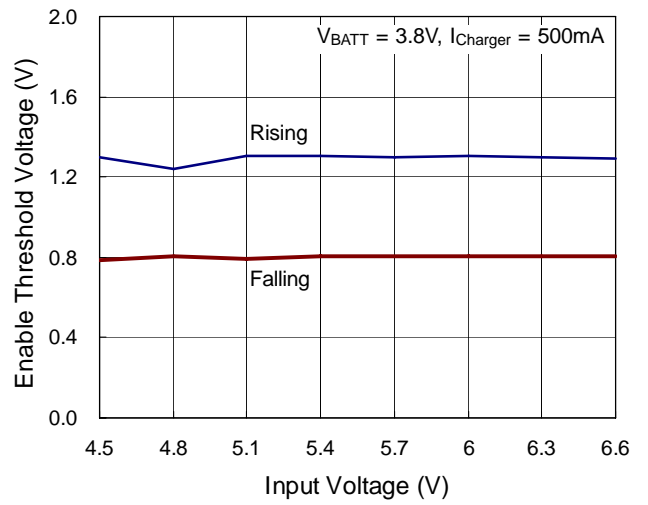

**Note 5.** Guaranteed by design.

## Application Information

The RT9503 is a fully integrated low cost single-cell Li-Ion battery charger for portable applications. The RT9503 can be adopted for two input power source, AC USB Input. It will automatically select the input source and operate in different mode as below.

**AC Mode :** When the AC input voltage (ACIN) is higher than the UVP voltage level (4.3V), the RT9503 will enter AC Mode. In the AC Mode, ACIN P-MOSFET is turned on and USB P-MOSFET is turned off. When ACIN voltage is between the UVP and OVP threshold levels, the switch Q1 will be turned on and Q2 will be turned off. So, the system load is powered directly from the adapter through the transistor Q1, and the battery is charged by the RT9503. Once the ACIN voltage is higher than the OVP or is lower than the UVP threshold, the RT9503 stops charging, and then Q1 will be turned off and Q2 will be turned on to supply the system by battery.

**USB Mode :** When AC input voltage (ACIN) is lower than UVP voltage level and USB input voltage is higher than UVP voltage level (3.9V), the RT9503 will operate in the USB Mode. In the USB Mode, ACIN P-MOSFET and Q1 are turned off and USB P-MOSFET and Q2 are turned on. The system load is powered directly from the USB/Battery through the switch Q2. Note that in this mode, the battery will be discharged once the system current is higher than the battery charge current.

**Sleep Mode :** The RT9503 will enter Sleep Mode when both AC and USB input voltage are removed. This feature provides low leakage current from the battery during the absence of input supply.

Figure 1. Input Power Source Operation Mode

## Power-Path Management

The RT9503 powers the system and independently charging the battery while the input is AC. This features reduces the charge time, allows for proper charge termination, and allows the system to run with an absent or defective battery pack.

### Case 1 : Input is AC

In this case, the system load is powered directly from the AC adapter through the transistor Q1. For RT9503, Q1 and Q2 act as a switch as long as the RT9503 is ready. Once the AC voltage is ready (>UVP and <OVP), the battery charge by RT9503 internal MOSFET and Q1 starts regulating the output voltage supply system (Q2 is turn off). Once the AC voltage over operation voltage (<UVP or >OVP), the RT9503 stop charge battery, Q1 turns off and Q2 starts supply power for system.

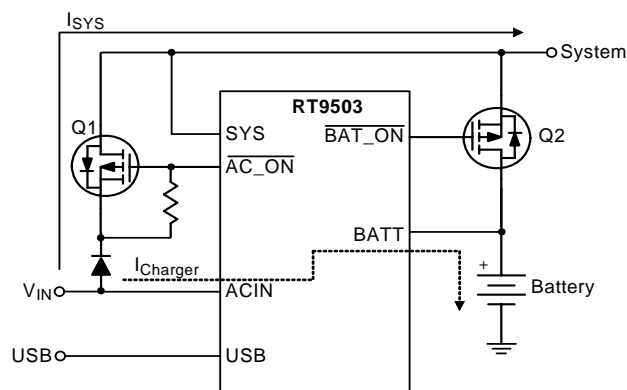

Figure 2. ACIN Input

### Case 2 : Input is USB

In this case, the system load is powered directly from the battery through the switch Q2 (Q1 is turn off). Note in this case, the system current over battery charge current will lead to battery discharge.

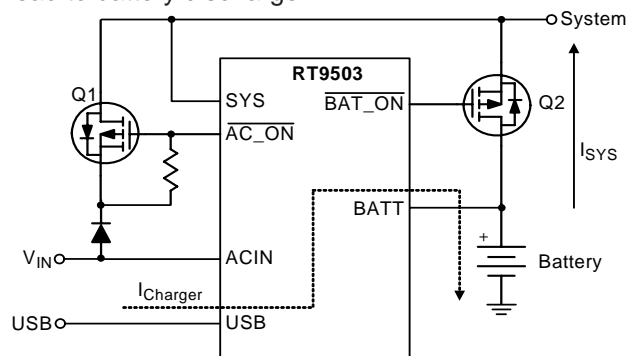

Figure 3. USB Input

**ACIN Over-Voltage Protection**

The ACIN input voltage is monitored by an internal OVP comparator. The comparator has an accurate reference of 2.5V from the band-gap reference. The OVP threshold is set by the internal resistive. The protection threshold is set to 6.5V, but ACIN input voltage over 18V still leads the RT9503 to damage. When the input voltage exceeds the threshold, the comparator outputs a logic signal to turn off the power P-MOSFET to prevent the high input voltage from damaging the electronics in the handheld system. When the input over Voltage condition is removed (ACIN < 6V), the comparator re-enables the output by running through the soft-start.

**Battery Temperature Monitoring**

The RT9503 continuously monitors battery temperature by measuring the voltage between the TS and GND pins.

The RT9503 has an internal current source to provide the bias for the most common 10kΩ negative-temperature coefficient thermal resistor (NTC) (see Figure 4). The RT9503 compares the voltage on the TS pin against the internal VTS\_HIGH and VTS\_LOW thresholds to determine if charging is allowed. When the temperature outside the VTS\_HIGH and VTS\_LOW thresholds is detected, the device will immediately stop the charge. The RT9503 stops charge and keep monitoring the battery temperature when the temperature sense input voltage is back to the threshold between VTS\_HIGH and VTS\_LOW, the charger will be resumed. Charge is resumed when the temperature returns to the normal range. However the user may modify thresholds by the negative-temperature coefficient thermal resistor or adding two external resistors. (see Figure 5.)

The capacitor should be placed close to TS (Pin 9) and connected to the ground plane. The capacitance value (0.1uF to 10uF) should be selected according to the quality of PCB layout. It is recommended to use 10uF if the layout is poor if prevent noise.

$$V_{TS} = I_{TS} \times R_{NTC}$$

Turn off when  $V_{TS} \geq 2.5V$  or  $V_{TS} \leq 0.5V$

Figure 4. Temperature Sensing Configuration

$$V_{TS} = I_{TS} \frac{R_{T2} \times (R_{T1} + R_{NTC})}{R_{T1} + R_{T2} + R_{NTC}}$$

Turn off when  $V_{TS} \geq 2.5V$  or  $V_{TS} \leq 0.5V$

Figure 5. Temperature Sensing Circuit

**Fast-Charge Current Setting**

**Case 1: ACIN Mode**

The RT9503 offers ISETA pin to determine the ACIN charge rate from 100mA to 1.2A. The charge current can be calculated as following equation.

$$I_{charge\_ac} = K_{SET} \frac{V_{SET}}{R_{SETA}}$$

The parameter  $K_{SET} = 300$  ;  $V_{SET} = 2.5V$ .  $R_{SETA}$  is the resistor connected between the ISETA and GND.

Figure 6. AC Mode Charge Current Setting

**Case 2 : USB Mode**

When charging from a USB port, the ISETU pin can be used to determine the charge current of 100mA or 500mA. A low-level signal of ISETU pin sets the charge current at 100mA and a high level signal sets the charge current at 500mA.

**Pre- Charge Current Setting**

During a charge cycle if the battery voltage is below the V<sub>PRECH</sub> threshold, the RT9503 applies a pre-charge mode to the battery. This feature revives deeply discharged cells and protects battery life. The RT9503 internal determines the pre-charge rate as 10% of the fast-charge current.

**Battery Voltage Regulation**

The RT9503 monitors the battery voltage through the BATT pin. Once the battery voltage level closes to the V<sub>REG</sub> threshold, the RT9503 voltage enters constant phase and the charging current begins to taper down. When battery voltage is over the V<sub>REG</sub> threshold, the RT9503 will stop charge and keep to monitor the battery voltage. However, when the battery voltage decreases 100mV below the V<sub>REG</sub>, it will be recharged to keep the battery voltage.

**Charge Status Outputs**

The open-drain  $\overline{\text{CHG\_S}}$  and  $\overline{\text{AC\_PGOOD}}$  outputs indicate various charger operations as shown in the following table. These status pins can be used to drive LEDs or communicate to the host processor. Note that ON

indicates the open-drain transistor is turned on and LED bright.

Charge State		$\overline{\text{CHG\_S}}$	$\overline{\text{AC\_PGOOD}}$
ACIN	Charge	ON	ON
	Charge Done	OFF	ON
USB	Charge	ON	OFF
	Charge Done	OFF	OFF

**Temperature Regulation and Thermal Protection**

In order to maximize charge rate, the RT9503 features a junction temperature regulation loop. If the power dissipation of the IC results in a junction temperature greater than the thermal regulation threshold (125°C), the RT9503 throttles back on the charge current in order to maintain a junction temperature around the thermal regulation threshold (125°C). The RT9503 monitors the junction temperature, T<sub>J</sub>, of the die and disconnects the battery from the input if T<sub>J</sub> exceeds 125°C. This operation continues until junction temperature falls below thermal regulation threshold (125°C) by the hysteresis level. This feature prevents the maximum power dissipation not exceeded typical design conditions.

**External Timer**

As a safety mechanism the RT9503 has a user-programmable timer that monitors the pre-charge and fast charge time. This timer (charge safety timer) is started at the beginning of the pre-charge and fast charge period. The safety charge timeout value is set by the value of an external capacitor connected to the TMR pin (C<sub>TMR</sub>), if pin TMR is short to GND, the charge safety timer is disabled.

As C<sub>TMR</sub> = 0.1uF, T<sub>PRECH</sub> is ~2460 secs and T<sub>FAULT</sub> is 8 x T<sub>PRECH</sub>. T<sub>PRECH</sub> = C<sub>TMR</sub> x 2460/0.1u

As timer fault, re-plug-in power or pull high and re-pull low EN can release the fault condition.

As a safety mechanism, the RT9503 has a user-programmable timer that monitors the pre-charge and fast charge time. This timer(charge safe timer) is started at the beginning of the pre-charge and fast-charge period. The safety charge timeout value is set by an external capacitor (CT) connected between TIMER pin and GND. The timeout fault condition can be released by resetting

the input power or the EN pin. If the TIMER is shorted to GND, the charge safety timer will be disabled.

**Selecting the Input and Output Capacitors**

In most applications, the most important is the high frequency decoupling capacitor on the input of the RT9503.

A 1uF ceramic capacitor, placed in close proximity to input pin and GND pin is recommended. In some applications depending on the power supply characteristics and cable length, it may be necessary to add an additional 10uF ceramic capacitor to the input. The RT9503 requires a small output capacitor for loop stability. A 1uF ceramic capacitor placed between the BATT pin and GND is typically sufficient.

**Thermal Considerations**

For continuous operation, do not exceed absolute maximum operation junction temperature. The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between junction to ambient. The maximum power dissipation can be calculated by following formula :

$$P_{D(MAX)} = ( T_{J(MAX)} - T_A ) / \theta_{JA}$$

Where  $T_{J(MAX)}$  is the maximum operation junction temperature 125°C,  $T_A$  is the ambient temperature and the  $\theta_{JA}$  is the junction to ambient thermal resistance.

For recommended operating conditions specification, where  $T_{J(MAX)}$  is the maximum junction temperature of the die (125°C) and  $T_A$  is the ambient temperature. The junction to ambient thermal resistance  $\theta_{JA}$  is layout dependent. For WQFN-16L 3x3 packages, the thermal resistance  $\theta_{JA}$  is 60°C/W on the standard JEDEC 51-7 four layers thermal test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated by following formula :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (60^\circ\text{C/W}) = 1.667\text{W for WQFN-16L 3x3 packages}$$

The maximum power dissipation depends on operating ambient temperature for fixed  $T_{J(MAX)}$  and thermal resistance  $\theta_{JA}$ . For WQFN-16L 3x3 package, the Figure 7 of derating curves allows the designer to see the effect of rising ambient temperature on the maximum power allowed.

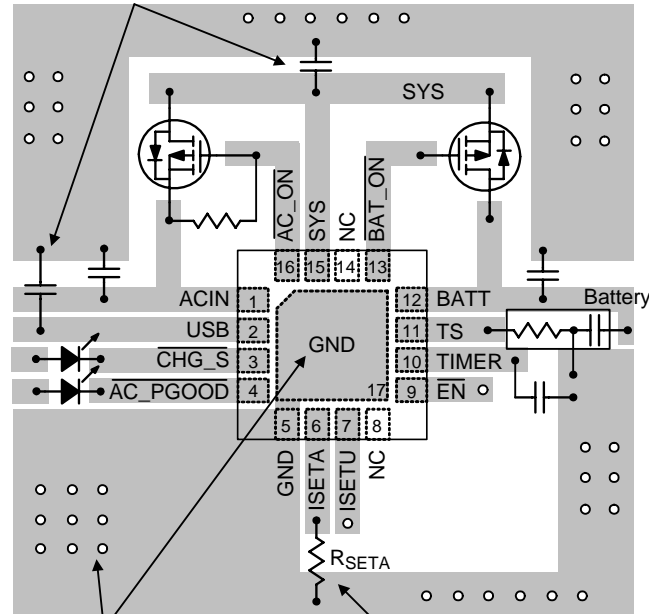

Figure 7. Derating Curves for RT9503 Package

**Layout Consideration**

The RT9503 is a fully integrated low cost single-cell Li-Ion battery charger ideal for portable applications. Careful PCB layout is necessary. The following guidelines should be strictly followed to achieve best performance of RT9503.

- ▶ Input capacitor should be placed close to the IC and connected to the ground plane. The trace of the input in the PCB should be placed far away from the sensitive devices or shielded by the ground.
- ▶ The GND should be connected to a strong ground plane for heat sinking and noise protection.
- ▶ The connection of the  $R_{SETA}$  should be isolated from other noisy traces. The short wire is recommended to prevent EMI and noise coupling.
- ▶ Output capacitor should be placed close to the IC and connected to ground plane to reduce noise coupling.

The capacitors should be placed close to the IC and connected to ground plane.

The GND should be connected to a strong ground plane for heat sinking and noise protection.

The connection of RSETA should be isolated from other noisy traces.
